....and growing!

Why Choose Us...

Zetaris solves the problem!

The Problem

**The old way of completing data
projects are slow and costly.**

**That means business opportunities
are adversely effected. Reducing
revenue or increasing cost.**

Using Zetaris for Data Virtualization enables real time data integration which in turn creates new business opportunities wilts improving data security by centralizing access control at the consolidated data layer level rather than the single data source level.

Zetaris has several benefits, including:

Accessibility: Putting data accessibility in the hands of the business leaders

Reduced cost: reduced over all cost up to 1/3 and reduced cloud cost by up to 30%

Efficiency: increased efficiency by increasing the speed of projects to 6x faster than traditional models at 1/4 of the FTE need.

Zetaris is a technology platform that allows users to access and integrate data from a variety of sources at the best price and performance by combining the five integration styles (Streaming, ETL/ELT, Replication, Data Virtualization, and CDC)

We use a combination of proprietary and open source software to create a virtual data layer that sits on top of the underlying data sources. This layer acts as a single access point for users, allowing them to query and retrieve data from multiple sources as if they were a single data store.

Zetaris is often used in situations where it is necessary to integrate data from a variety of sources, such as in business intelligence and analytics applications. It can also be used to support data migration and data consolidation projects.
